ABSTRACT

CONTROLLING TELEVISION VIEWING CONTENT

A method, system and computer program product for controlling the content of broadcast material. A master unit may be configured to record a broadcast displayed on the master unit. The master unit may be configured to assign a session to the recorded broadcast. A session may refer to a particular instance of the recorded broadcast. The master unit may be configured to receive input as to which subsidiary unit, e.g., television set, is associated with the assigned session. The master unit may be configured to spawn a thread associated with the assigned session. By spawning a thread for each session assigned, multiple sessions may be assigned for a particular broadcast. Thus, a user, e.g., teacher, parent, guardian, viewing the broadcast may be able to edit, e.g., delete, annotate, a particular broadcast for various age groups which may ultimately be transmitted to different subsidiary units viewed by different age groups.
